For Immediate Release

### **Managing public consultations made easier with Web-based software**

(Vancouver, BC, Canada – January 18, 2007) Organizations who conduct public consultations or manage stakeholder relations finally have a tool to document and report on all their stakeholder interactions in a single accessible database. SustainNet Software Solutions is now distributing a Web-based information management system that collects accurate, reliable and well-documented records of all interactions with stakeholders and the public for analysis, reporting and decision-making.

“Just about every organization that consults with stakeholders is looking for a better way to organize all the information they need to generate meaningful and accurate reports for decision making,” says Howard Adam, President of SustainNet Software Solutions ([www.sustainet.com](http://www.sustainet.com)). “I constantly hear from customers how excited they are to discover our new offering, Consultation Manager, a dedicated product which stores and reports on all the information collected during stakeholder engagement events, while respecting privacy concerns.”

SustainNet chose to represent Consultation Manager and adapt it for Canada because it manages all the phone calls, open houses and public events related to one or many small and large public consultation projects simultaneously while facilitating communication and immediate feedback with stakeholders. By streamlining and producing efficient access to data, Consultation Manager reduces the time spent managing and searching through complex information and quickly produces powerful reports that summarize stakeholder interactions. Consultation Manager improves accountability, transparency and generates audit trails.

Consultation Manager’s Project and Enterprise Editions are available as hosted applications installed on secure servers in Canada, and do not require any installation of software on a company’s network. Developed by MySite Design Pty Ltd, Consultation Manager is used by organizations around the world in large and small infrastructure and community projects.

SustainNet Software Solutions Inc. ([www.sustainet.com](http://www.sustainet.com)), a global software distributor, represents a broad range of software products to help organizations manage the information required to meet their social responsibility and sustainable development goals.
